

### Grid computing: yesterday, today and tomorrow? Dr. Fabrizio Gagliardi

EMEA Director External Research Microsoft Research

#### Cracow Grid Workshop 2008 Cracow, October 14<sup>th</sup>

## Outline

Yesterday and today:

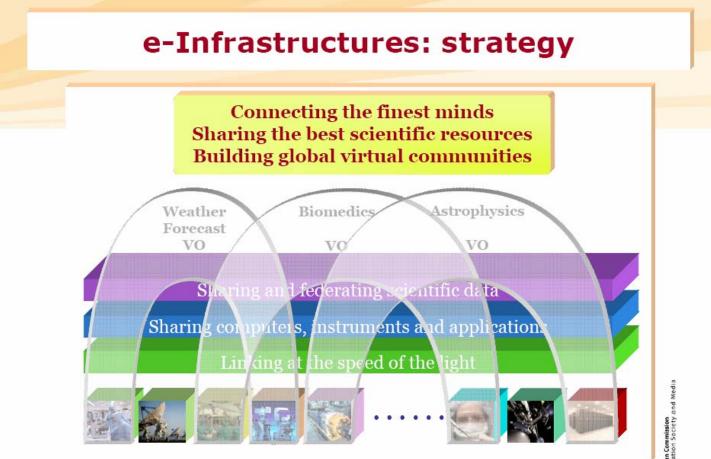

Achievements in the area of e-Infrastructures and Grid computing

- Examples beyond e-Science
- Issues : Complexity, Cost, Security, Standards
- The future:
  - Cloud Computing, Virtualisation, Data Centers, Software as a Service, Multi-core architectures, Green IT

Conclusions

#### The European Commission strategy for e-Science

Mario Campolargo, EC, DG INFSOM, Director of Directorate F: Emerging Technologies and Infrastructures

23/2000

#### e-Infrastructure HPC achievements: EGEE and DEISA

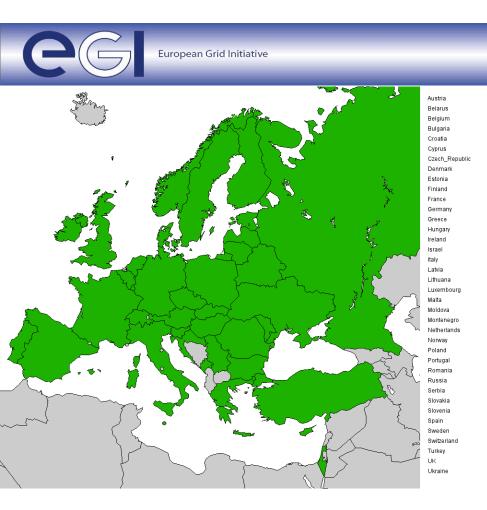

23/200

The DEISA supercomputing Grid

#### e-Infrastructure HPC next steps: EGI and PRACE

## In summary: Grid achievements for e-Science

- Grid for e-Science: mainly a success story!
- Several maturing Grid Middleware stack
- Many HPC applications using the Grid
  - Some (HEP, Bio) in production use
  - Some still in testing phase: more effort required to make the Grid their day-to-day workhorse
- e-Health applications also part of the GrideALTHGR
- Some industrial applications:
  - Early deployment mainly in different EC projects

LCG

#### **Achieving global e-Science**

## Grid achievements beyond e-Science

- Slower adoption: prefer different environments, tools and have different TCOs
  - Intra grids, internal dedicated clusters, cloud computing
- e-Business applications
  - Finance, ERP, SMEs and Banking!
  - New economic and business models
- Industrial applications
  - Energy, Automotive, Aerospace, Pharmaceutical industry, Telecom
    - 🔊 EGEODE VO

- e-Government applications
  - Earth Observation, Civil protection:
  - e.g. The Cyclops project
    - CGW'08, Cracow, Poland

# **Examples beyond e-Science**

**CitiGroup (**Citigroup Inc., operating as Citi, is a major <u>American financial</u> <u>services</u> company based in <u>New York City</u>) adopted Grid computing

http://www.americanbanker.com/usb\_article.html?id=20080825IXTFW8BS

- Citi chose **Platform Computing's Symphony grid product** to consolidate its computing assets into a single resource pool with increased utilization

- At Citi, since the grid was implemented, individual business units are charged for the processing power they use, creating **a shared services environment** 

-Citi is now using near **20,000 CPUs** and there are periods of the day where the **utilization rate is 100 percent** 

-Citi is planning of using the cloud in cases their data centers do not suffice (**overflow model** or cooperative data centers)

# **Grid achievements in industry**

- IT Industry demonstrated interest in becoming an Grid infrastructure provider and/or user (intra-grids):
  - On-demand infrastructures:
    - Cloud and Elastic computing, pay as you go...
    - Data centers: Data getting more and more attention
  - Service hosting: outsourced integrated services
    - Software as a Service (SaaS)
    - (e.g. Salesfoce.com services)

- Virtualisation being exploited in Cloud and Elastic computing (e.g. Amazon EC2 virtual instances)
- "Pre-commercial procurement"
  - Research-industry collaboration in Europe to achieve new leading-edge products
    - Example: PRACE building a PetaFlop Supercomputing Centre in Euro

#### The HPC view from ...the clouds!

#### Not All Clouds are Alike

- Flexible but complex: the Grid Grids imply dynamic arrival/departure Grids may include specialized nodes
- Cost-effective but confined: the Cluster Clusters are typically monocultures: just one type of node Applications may require tuning to a particular cluster size

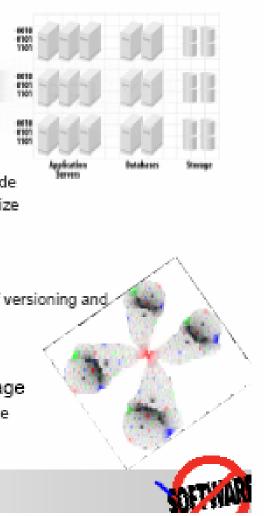

#### Responsive but repetitive: the Hypervisor

Virtualized servers can be quickly provisioned Software stack within the virtual server retains issues of versioning and configuration

Virtual appliances demand monitoring/management

 Enterprise cloud computing implies API leverage Immediate focus on function; immediate delivery of value Concerns arise around perception of platform lock-in

# **Today and the future:** Green IT, pay per CPU/GB virtualisation and/or HPC in every lab?

- Computer and data centers in energy and environmental favorable locations are becoming important
- Elastic computing, Computing on the Cloud, Data Centers and Service Hosting - Software as a Service, are becoming the new emerging solutions for HPC applications
- Many-multi-core and CPU accelerators are promising potential breakthroughs
- Green IT initiatives:

23/2000

- The Green Grid (<u>www.thegreengrid.org</u>) consortium (AMD, APC, Dell, HP, IBM, Intel, Microsoft, Rackable Systems, Sun Microsystems and Vmware)
- IBM Project Big Green (a \$1 billion investment to dramatically increase the efficiency of IBM products) and other IT industry initiatives try to address current HPC limits in energy and environmental impact requirements

## **Today and the future:** Cloud computing and storage on demand

CGW'08, Cracow, Poland

15

# EGEE cost estimation (1/2)

#### **Capital Expenditures (CAPEX):**

3/2000

a. Hardware costs: 80.000 CPUs ~ in the order of 120M Euros (80-160M)

Depreciating the infrastructure in 4 years:30Meuros per year (20M to 40M)

b. Cooling and power installations (supposing existing housing facilities available)

25% of H/W costs: 30M, depreciated over 5 years: 6M Euros

Total: ~ 36M Euros / year (26M-46M)

Slide Courtesy of Fotis Ka

# EGEE cost estimation (2/2)

#### **Operational Expenditures (OPEX):**

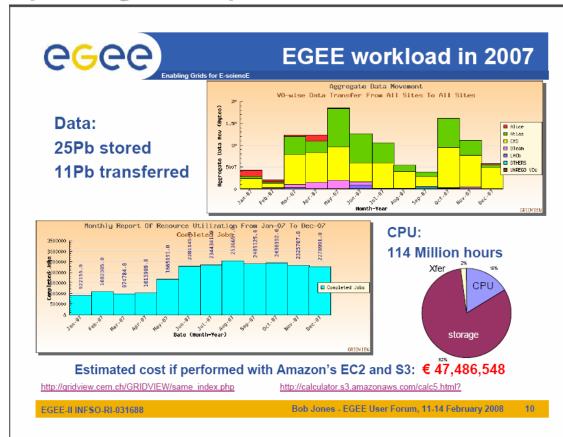

a. 20 MEuros per year for all EGEE costs (including site administration, operations, middleware etc.)

b. Electricity ~10% of h/w costs: 12M Euros per year (other calculations lead to similar results)

c. Internet connectivity: Supposing no connectivity costs (existing over-provisioned NREN connectivity) \*If other model is used (to construct the service from scratch), then network costs should be taken into account Total 32M / year CAPEX+OPEX= 68M per year (58-78M)

# EGEE if performed with Amazon EC2 and S3

In the order of ~50M Euros, probably more cost effective of EGEE actual cost, depending on the promotion of the EC2/S3 service

Slide Courtesy of Bob

# Cloud mature enough for big sciences?

**Probably not yet, as not designed for them; Does not support complex Scenarios:** "S3 lacks in terms of flexible access control and support for delegation and auditing, and it makes implicit trust assumptions"

#### Are commercial computing clouds ready for high-energy physics? RSS May 23, 2008 | 4:54 am View Feed Now that Web "cloud" computing and data storage are available through Amazon, Sun Microsystems, and IBM, is it time for Search high-energy physicists to ditch their traditional, custom-built computing networks in favor of commercial services? **Recent Posts** A new study looks at this guestion in detail for perhaps the first time. The conclusion: Not yet. In a paper available here, the Particle physics creates the right path researchers outline a number of things that would need to change before Amazon's S3 data storage and EC2 computing to frontiers services could meet the sophisticated data-heavy needs of physicists. Fermilab hears views from Washington, DC CMS physicists prepare for LHC dress The researchers traced 27 months' worth of data usage by DZero, one of two experiments at Fermilab's Tevatron accelerator, to rehearsal see how physicists actually handle and crunch data. The study analyzed 113,062 DZero jobs executed between January 2003 What will be the FY09 budget? and March 2005. These involved nearly a million hours of computation and processed more than 5.2 million gigabytes of data. Tech magnate donates another \$50 million to Canada's Perimeter Institute The study tested the reliability and accessibility of Amazon's Simple Storage Service (S3) and Elastic Compute Cloud (EC2) from five public Internet nodes in the US and Europe. Archives June 2008 The authors are Mayur Palankar and Adriana lamnitchi of the University of South Florida, Matei Ripeanu of the University of May 2008 http://www.Symmetreymagazine.org/breaking/2008/05/23/are-commercial-computing-clouds-

ready-for-high-energy-physics/ http://www.csee.usf.edu/~anda/papers/dadc108-palankar.pdf

#### The future:

#### "To Distribute or Not To Distribute"

 Prof. Satoshi Matsuoka, TITech

 Keynote at Mardi Gras
Conference
Baton Rouge,
31 Jan 2008

- In the late 90s, petaflops were considered very hard and at least 20 years off ...
- while grids were supposed to happen right way
- After 10 years (around now) petaflos are "real close" but there's still no "global grid"
- What happened:
- → It was easier to put together massive clusters than to get people to agree about how to share their resources
- → For tightly coupled HPC applications, tightly coupled machines are still necessary
- → Grids are inherently suited for loosely coupled apps
- With Give Sing Stand Mathachine complete restaurces will promote thin client approach
- "Bandwidth grows at least three times faster than <u>computer power</u>." This means that if computer power doubles every eighteen months (per <u>Moore's Law</u>), then communications power doubles every six months
- Example: *Tsubame* machine in Tokyo

# **Multi-core architectures**

- Computer CPUs have adopted multi-core architectures with increasing number of cores
  - 2-4 cores in PCs and laptops
  - 8-32 cores in servers, 64-80 cores under development
  - Intel announced a 6 core Xeon

- The trend is driven by many factors:
  - Power consumption, heat dissipation, energy cost, availability of high bandwidth computing at lower cost, ecological impact
- The entire software ecosystem will need to adapt including related applications

# Conclusion (1/2)

- We are at a flex point in the evolution of distributed computing
  - nothing new under the sun...!

23/2005

- Grid has delivered an affordable HPC infrastructure
- to scientists all over the world to solve intense computing and storage problems within constrained research budget (and often for social/political reasons) Grid computing
- leveraging international research networks to deliver an effective and irreplaceable channel for international collaboration
- This has also been effectively used by **industry**
- to increase the usage of their HPC infrastructure and reduce Total Cost of Ownership (TCO)
- Major issues with wide adoption of Grids have to do with:
- Cost of operations, complexity, not a solution for all problems (latency, fine grain parallelism are difficult), reliability, security...

# Conclusion (2/2)

- Cloud computing and hosted services are emerging as the next incarnation of distributed computing with some obvious additional advantages but not really designed with scientific applications in mind
- Many changes are happening in the basic underpinning technology (**parallel everywhere**!)
- New boundary constraints and very much energy are becoming the limiting factor to the otherwise still valid Moore's Law...
- If we will be able to harness the potential enormous power of parallel computing (not so good story so far) then we might be able to provide better computing solutions for research in energy and eventually better energy solutions for our computing needs!

3/200

## Thanks
